## 2024\_28\_III\_OOPS Using Java Lab

### **REC\_2028\_OOPS using Java\_Week 10\_PAH**

Attempt : 1

Total Mark : 30

Marks Obtained : 30

#### **Section 1 : Coding**

##### **1. Problem Statement**

Riya is building a calendar event scheduler where each event is stored in chronological order using a TreeMap. The key represents the event time in 24-hour format (HH:MM), and the value is the event description.

She wants the system to:

Automatically sort events by time. Avoid duplicate time entries – if a duplicate time is entered, ignore the new entry. Print all scheduled events in order.

Implement this logic using a class named EventManager.

##### ***Input Format***

The first line of the input contains an integer n, representing the number of events.

The next n lines each contain a string in the format: "HH:MM Description"  
(Example: 09:00 TeamMeeting).

#### ***Output Format***

The first line of the output prints "Scheduled Events:"

The next k lines print each event in the format: "HH:MM - Description"

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 5  
09:00 TeamMeeting  
13:30 LunchBreak  
11:00 ProjectUpdate  
09:00 Standup  
15:00 ClientCall

Output: Scheduled Events:

09:00 - TeamMeeting  
11:00 - ProjectUpdate  
13:30 - LunchBreak  
15:00 - ClientCall

#### ***Answer***

```
// You are using Java
import java.util.*;
class ss{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int n=s.nextInt();
        s.nextLine();
        TreeMap<String,String>arr=new TreeMap<>();
        for(int i=0;i<n;i++){
            String g=s.nextLine();
            String[] gg=g.split(" ",2);
            String a=gg[0];
            String b=gg[1];
```

```
        if(!arr.containsKey(a)){
            arr.put(a,b);
        }
    }
    System.out.printf("Scheduled Events:\n");
    for(String time:arr.keySet()){
        System.out.println(time+" - "+arr.get(time));
    }
}
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

A university maintains a list of student records and wants to store them in a sorted manner based on their GPA. If two students have the same GPA, they should be further sorted by their name in lexicographical order. Implement a program that uses a TreeSet to store student records and ensures unique student IDs.

### ***Input Format***

The first line contains an integer N - the number of students.

The next N lines contain details of each student in the format: "StudentID Name GPA"

- StudentID (Integer) - A unique identifier.
- Name (String) - The student's name (can contain spaces).
- GPA (Double) - The Grade Point Average.

### ***Output Format***

The output prints the list of students in ascending order of GPA.

If two students have the same GPA, sort them by name.

Print details in the format: "StudentID Name GPA" in the output, GPA is rounded to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5  
101 John 8.5  
102 Alice 9.1  
103 Bob 8.5  
104 Zoe 7.3  
105 Charlie 9.1

Output: 104 Zoe 7.30  
103 Bob 8.50  
101 John 8.50  
102 Alice 9.10  
105 Charlie 9.10

### **Answer**

```
import java.util.*;  
class Student implements Comparable<Student> {  
    int studentID;  
    String name;  
    double gpa;  
  
    public Student(int studentID, String name, double gpa) {  
        this.studentID = studentID;  
        this.name = name;  
        this.gpa = gpa;  
    }  
  
    public int compareTo(Student other) {  
        if (this.gpa != other.gpa) {  
            return Double.compare(this.gpa, other.gpa);  
        }  
        return this.name.compareTo(other.name);  
    }  
  
    public String toString() {  
        return studentID + " " + name + " " + String.format("%.2f", gpa);  
    }  
}  
class UniversityRecords {
```

```
public static void main(String[] args) {  
    Scanner sc = new Scanner(System.in);  
    int n = sc.nextInt();  
    sc.nextLine();  
    TreeSet<Student> studentSet = new TreeSet<>();  
    for (int i = 0; i < n; i++) {  
        int id = sc.nextInt();  
        String name = sc.next();  
        double gpa = sc.nextDouble();  
        studentSet.add(new Student(id, name, gpa));  
    }  
    for (Student s : studentSet) {  
        System.out.println(s);  
    }  
    sc.close();  
}
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Sarah is working on a spam detection system that analyzes incoming messages for unique patterns. Spammers often use repetitive character sequences, making it important to identify the first non-repeating character in a message.

Given a string, Sarah needs to determine the first character that appears only once. If all characters repeat, the system should return -1.

She decides to use a HashMap to efficiently track character frequencies and find the solution.

#### ***Input Format***

The first line contains an integer N representing , the length of the string.

The second line contains a string of N lowercase English letters (a-z).

#### ***Output Format***

The output prints a character representing the first non-repeating character. If none exist, print -1.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 10  
abacabadac  
Output: d

### ***Answer***

```
// You are using Java
import java.util.*;
class d{
    public static void main(String[] args){
        Scanner s=new Scanner(System.in);
        int n=s.nextInt();
        s.nextLine();
        String ss=s.nextLine();
        HashMap<Character,Integer>arr=new HashMap<>();
        for(int i=0;i<n;i++){
            char ch=ss.charAt(i);
            if(arr.containsKey(ch)){
                arr.put(ch,arr.get(ch)+1);
            }
            else{
                arr.put(ch,1);
            }
        }
        char d='-';
        for(int i=0;i<n;i++){
            if(arr.get(ss.charAt(i))==1){
                d=ss.charAt(i);
                break;
            }
        }
        if(d=='-'){
            System.out.printf("-1");
        }
    }
}
```

```
        }  
    }  
}  
else{  
    System.out.print(d);  
}
```
